Problem 1.

(1) Estimated Functions:

$$\hat{y}_1(x) = 27.407x + 76.549 \quad (\text{Write numerical values for } a_i's \text{ and } b's)$$

$$\hat{y}_2(x) = -1.265x^2 + 27.028x + 88.441$$

$$\hat{y}_3(x) = 1.762x^3 + 1.368x^2 + 0.650x + 101.164$$

$$\hat{y}_4(x) = -2.251x^4 + 1.756x^3 - 8.883e-01x^2 - 6.519e-01x + 9.992e+01$$

$$\hat{y}_5(x) = 5.008e-03x^5 + -2.044e-02x^4 + 1.615e+00x^3 + -8.993e-01x^2 + 1.706e-01x + 9.971e+01$$

$$\hat{y}_6(x) = 4.057e-03x^6 + 5.285e-03x^5 + -1.621e-01x^4 + 1.638e+00x^3 + 3.354e-01x^2 + -2.381e-01x + 9.831e+01$$

(2) Data Visualization:

(Insert plot obtained from data in poly.txt. Note that the plot below is not the solution)

(3) What degree polynomial does the relationship seem to follow? Please explain your answer.

Sample answer:

The data seems to best follow a first order polynomial (i.e., a line) which can be seen from the low error between the estimated regression function, $\hat{y}_1(x)$ and the data in the plot above.

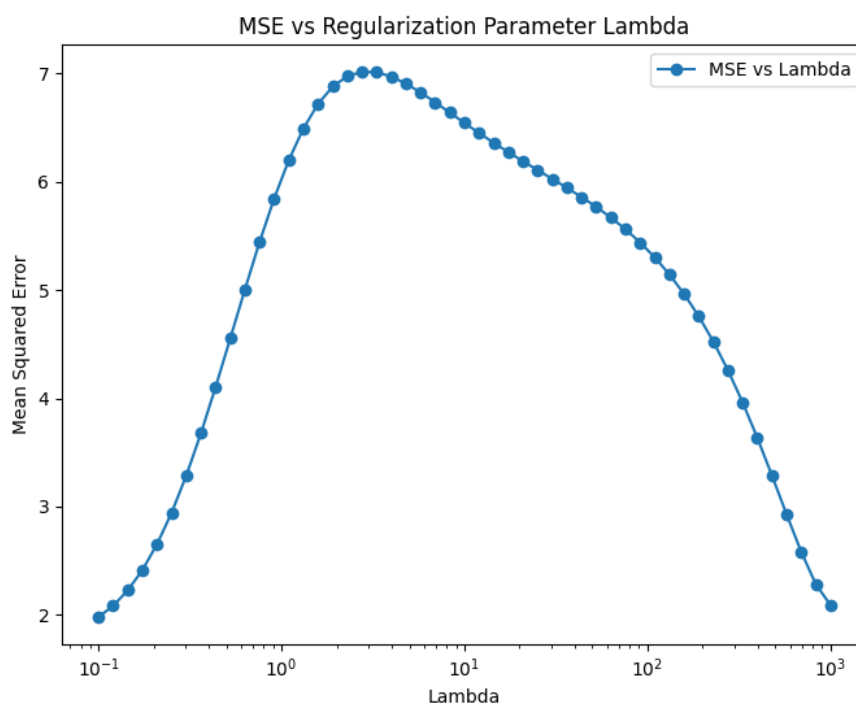

(4) If we measured a new data point, $x = 4$, what would be the predicted value of y , based on the polynomial identified as the best fit in Question (3)?

Predicted value for $x = 4$: 189.717

Problem 2.

(1) Plot the mean squared error as a function of lambda in Ridge Regression:

(Insert plot obtained by completing the *main* function. Note that the plot below is not the solution)

(2) Find best lambda:

Based on the range of Lambda values tested, the best lambda value is 0.1, which yields an MSE of 1.982 as shown on the plot above.

(3) Find equation of the best fitted model:

(Insert numerical values for a_i 's and b)

$$\hat{y}(x) = 1.982e - 01x_1 + 8.162e - 01x_2 + 5.195e - 01x_3 + 3.833e + 00x_4 \\ + 2.114e - 01x_5 + 4.537e - 04x_6 + 2.562$$

(4) Plot the predicted stock prices and actual stock prices using Google data

(Note that the plot below is not the solution)
